

# Summary of models

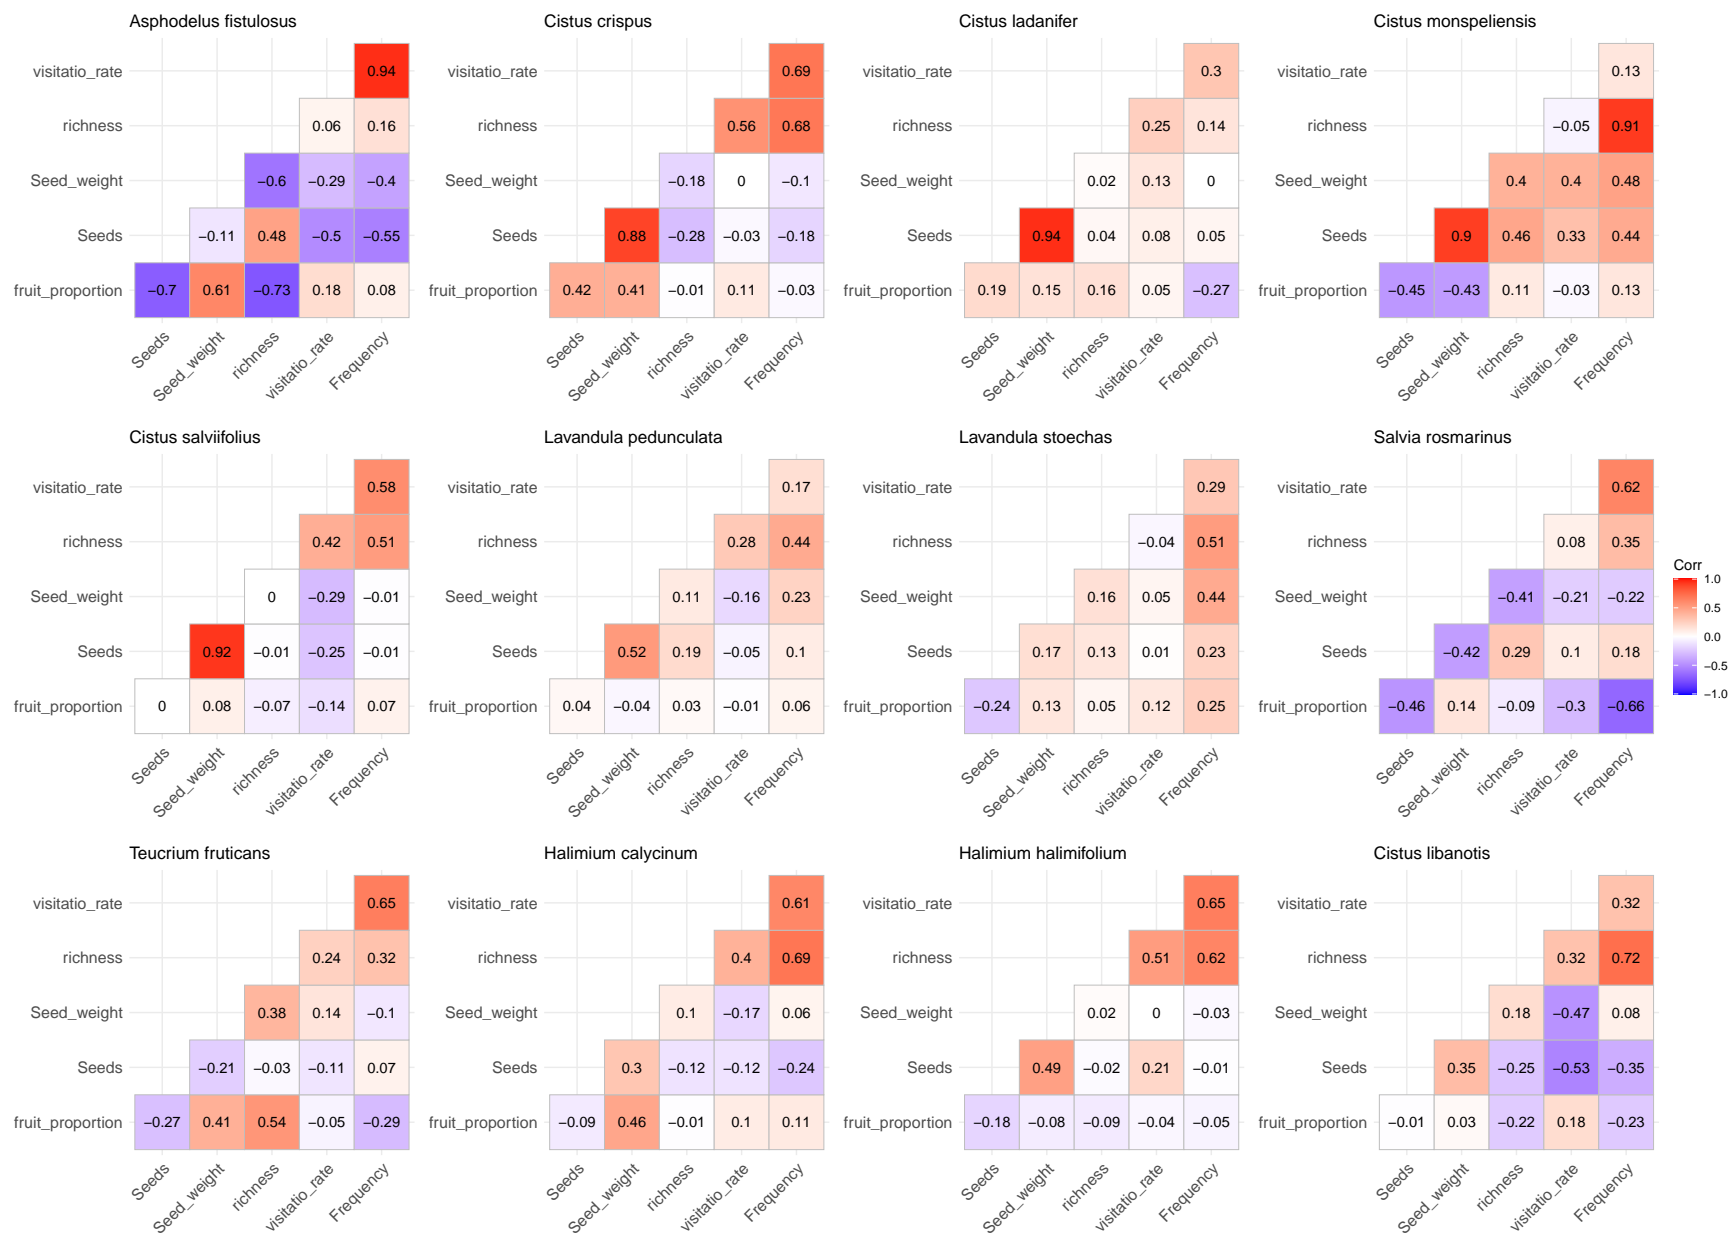

2022-07-08

Data base from beefun: plant individuals per sites (13 sites) for five years (2015-2019). Data base has 400 observation, only matching individuals, some with no pollinator frequency (16 observations). Fruit proportions, seed numbers and seed weight are calculated for each plant individual per plant species in site and year. Richness, visitation rate and frequency of pollinators are also calculated for plant individual per plant species. 16 plant species but 4 are removed because they are present only one site.

# Fruit proportion

## Richness

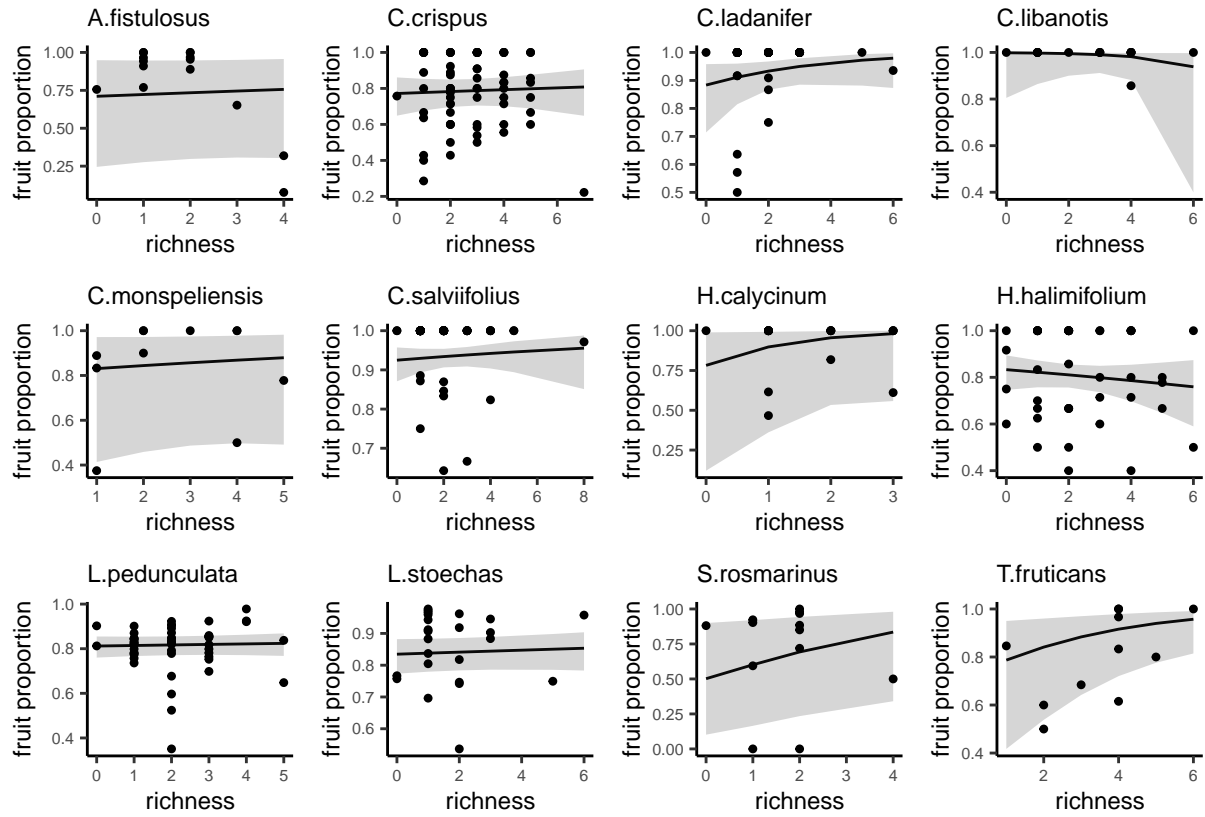

Summary of models for fruit proportion ~ pollinator richness per plant species. Binomial cbind(fruit\_formado, Fruit\_No), fruit formada= Fruit yes + fruit preyed + fruit dispersed. Site\_ID as factor random

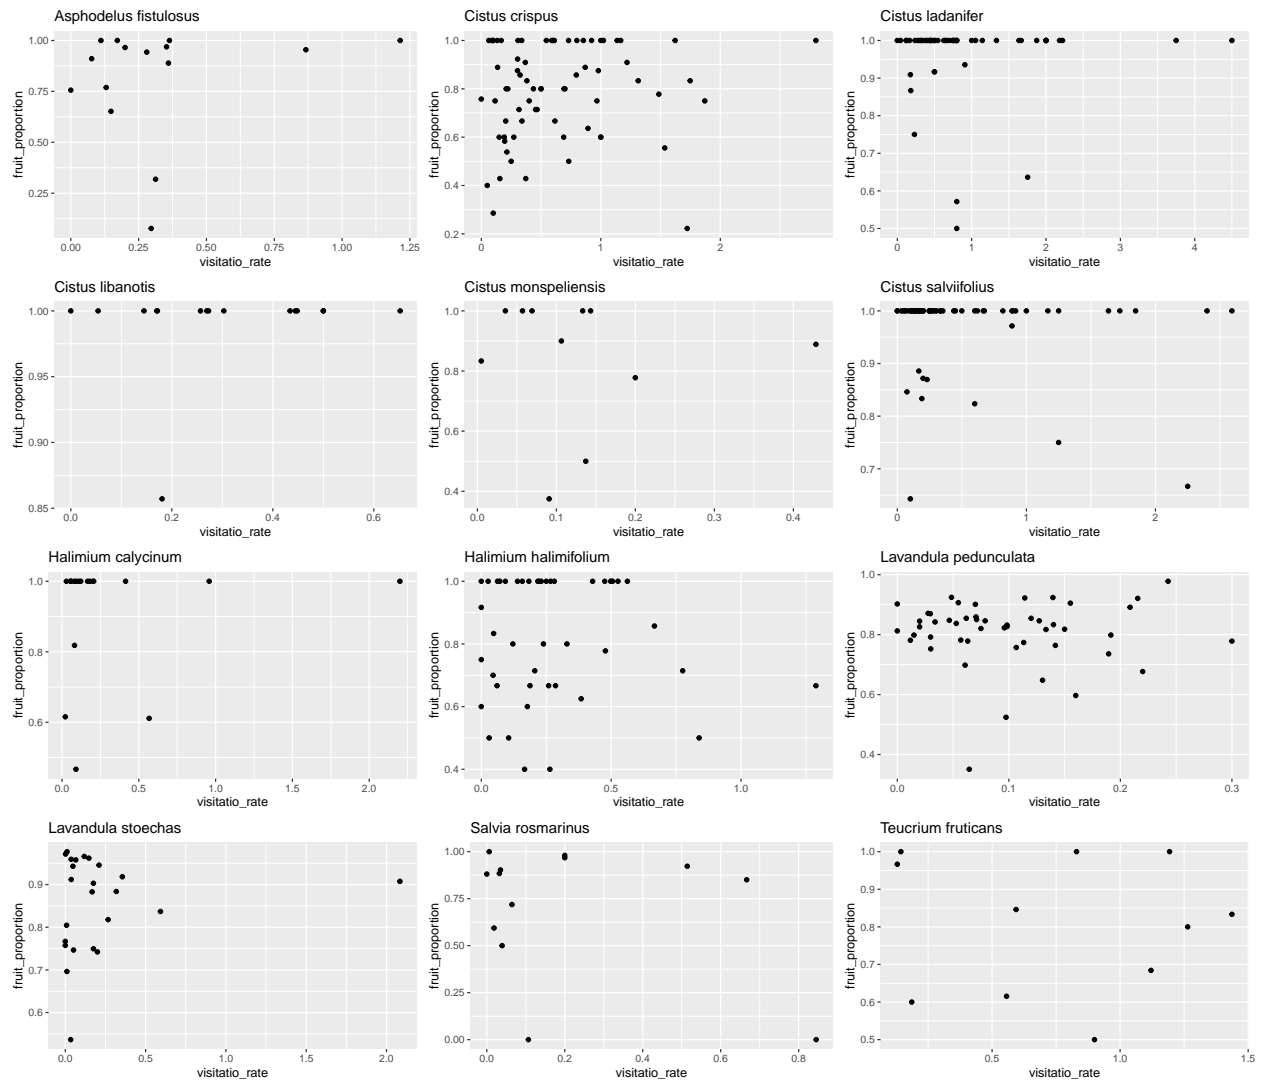

Note: NAs is replaced by zero. The plant species have fruit and seed data but no pollinator visiting were registered. No pollinator visit the plant species during observed time
